

AdvancedLive 11.0

Remotely controlling your fire system

What's new in release 11.0?

To give you more control of your fire system via AdvancedLive, you can now remotely mute and reset your panels, and silence and resound your sounders as the need arises.

Whenever your fire system goes into fire or fault condition, you'll see these new control options display within the 'panel view' of AdvancedLive.

For added speed, ease of use and safety, the mute, reset, silence and resound options are presented in a smart way, so only appropriate actions are displayed. For example, if there are new faults on the fire system, the mute option will appear; if a fire is detected and the sounders have been silenced, the resound option will display.

We've also added help text so users can be certain they are taking the right actions to protect people and premises.

As ever, to ensure site safety, the responsible person chooses and sets the user permissions for this new functionality. They can choose who's able to:

Mute panels or silence and resound sounders

Reset the fire system

To experience the changes, log in to your AdvancedLive account, contact your sales representative or email enquiries@advancedco.com
